

DEVELOPER CHEATS SYSTEM

OVERVIEW

The developer cheats system allows developers to cheat at Clean World. The script behind this system is `creativeModeScript.cs`, which sits on the `CreativeMode` game object. This system is quite useful when demonstrating the game, because I don't have the obscene amount of emotional energy required to play this thing for 40 minutes every time I want to show someone what the end of it looks like. I only did that a few times at the beginning of development. Those were dark days.

USING THE CHEAT SYSTEM

These are the instructions for using the cheat system at runtime. Please note that after beginning the game, you must enable cheats before you can use them.

Enabling Cheats

In order to use cheats at all, you must first enter the developer password: "milton". All you have to do is type the password once the game is running. Cheats will then automatically be enabled. A happy little sound should be played if enabling cheats is successful.

Tab + G

Turn creative mode off and on. In creative mode, you have infinite money and no longer have to worry about carbon.

Tab + M

Give yourself \$10,000.

Tab + O

Unlock all progress events (all tiles, new areas, all UI, etc).

Tab + A

Increase the max number of areas allowed by one.

ALTERING THE CHEATS SYSTEM

To perform the following actions, you will need to go under the CreativeMode game object and look at the creativeModeScript class in the Inspector.

Completely Disabling Cheats

To completely disable cheats in both the editor and the build, uncheck the box “Allow Cheats” under creativeModeScript.cs.

Disable Cheats in the Build

To disable cheats in the build but not in the editor, check the box “Disable Cheats In Build” under creativeModeScript.cs, while also leaving the “Allow Cheats” box checked.

Change the Password for Cheats

To change the password for cheats, change the string “Cheat Password” under creativeModeScript.cs from “milton” to whatever you want the password to be.
